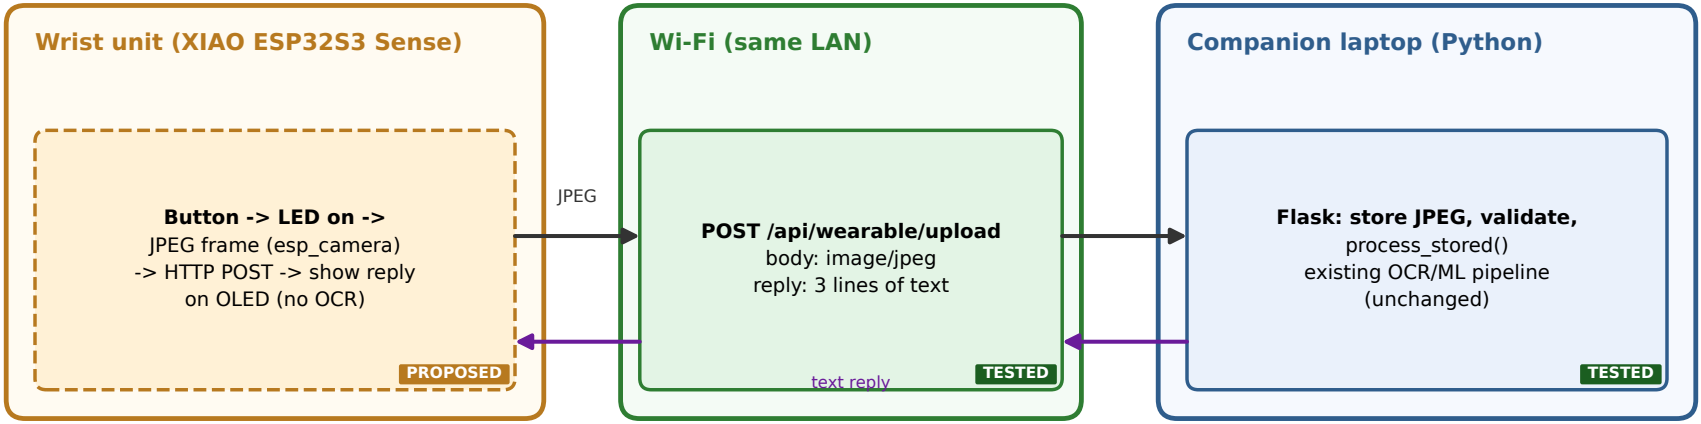
Wearable camera to companion: one HTTP request over Wi-Fi



Acquisition sources feeding the same pipeline (status of each)

1 Laptop webcam (OpenCV)

IMPLEMENTED

Capture + validation + pipeline. Tested with a test video file only; no physical webcam tested.

2 Image upload

TESTED

Automated tests with PNG/JPEG files; same entry point (identical results on identical pixels).

3 Wearable camera (HTTP POST)

NOT TESTED

Receiver tested with a Python client. Firmware compiles and boots in Wokwi, camera init fails there (no camera part). No physical camera, image capture or Wi-Fi POST from the device has been run.
